

Advanced Scalping Techniques (AST)

Variations on the 15-min Buy Setup (PBS)

Smaller timeframes will be used for these strategic entries...

Pattern # 1: The Vanilla

Pattern description (The Vanilla):

A rising stock above a rising 20ma that has pulled back on the 15-min chart and went into a downtrend on 2-min timeframe. The entry triggers once a green reversal bar goes above the prior bar's high on 15-min timeframe. However, the entry is not taken until the 2-min downtrend has been broken.

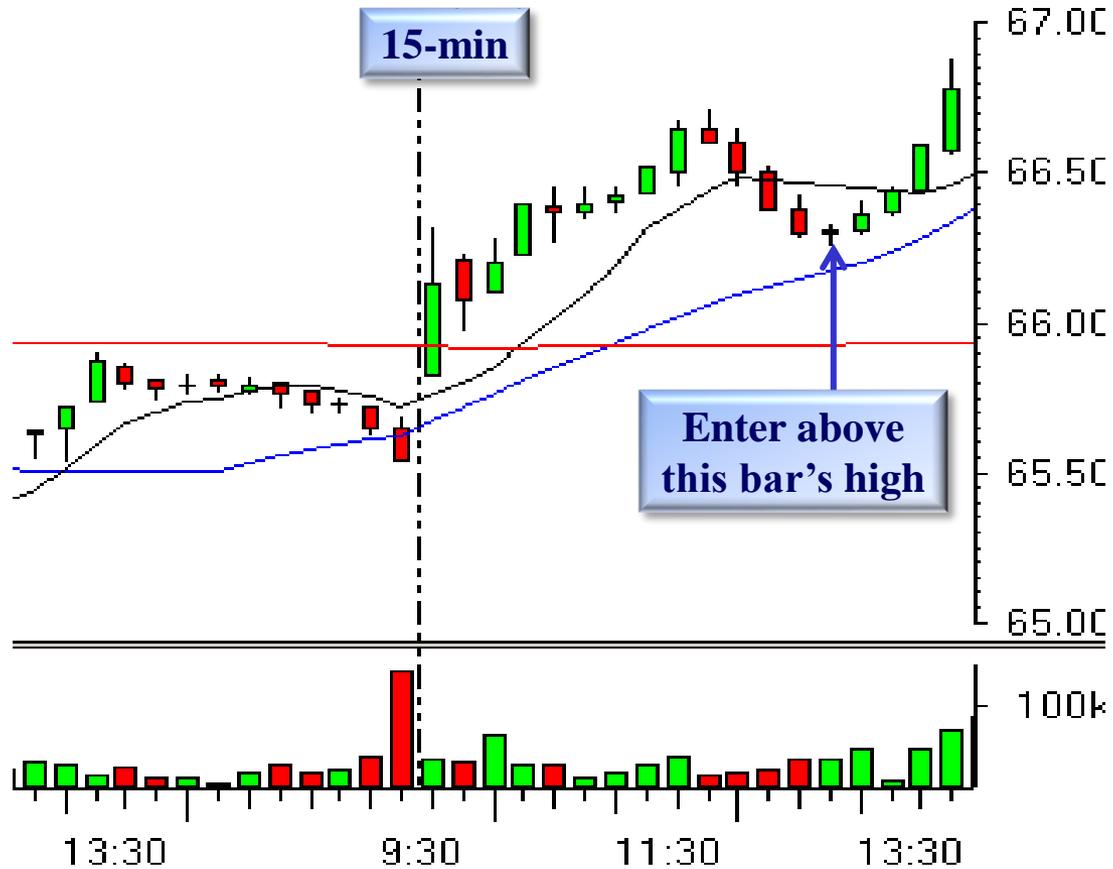

Pattern # 1: The Vanilla

A 15 minute Pristine buy setup (PBS), sitting on the 200 period moving average (200ma), and at the rising 20 period moving average (20ma), on strong minor support (mS), at a 50% retracement (50%), that forms with a bottoming tail (BT) and a narrow +COG

Variations on the 15-min Buy Setup (PBS)

Pattern # 1: The Vanilla

A smooth multi-bar pullback to the r20ma and Minor Support (mS), all above the flat 200ma make this a picture perfect 15-min buy setup.

Variations on the 15-min Buy Setup (PBS)

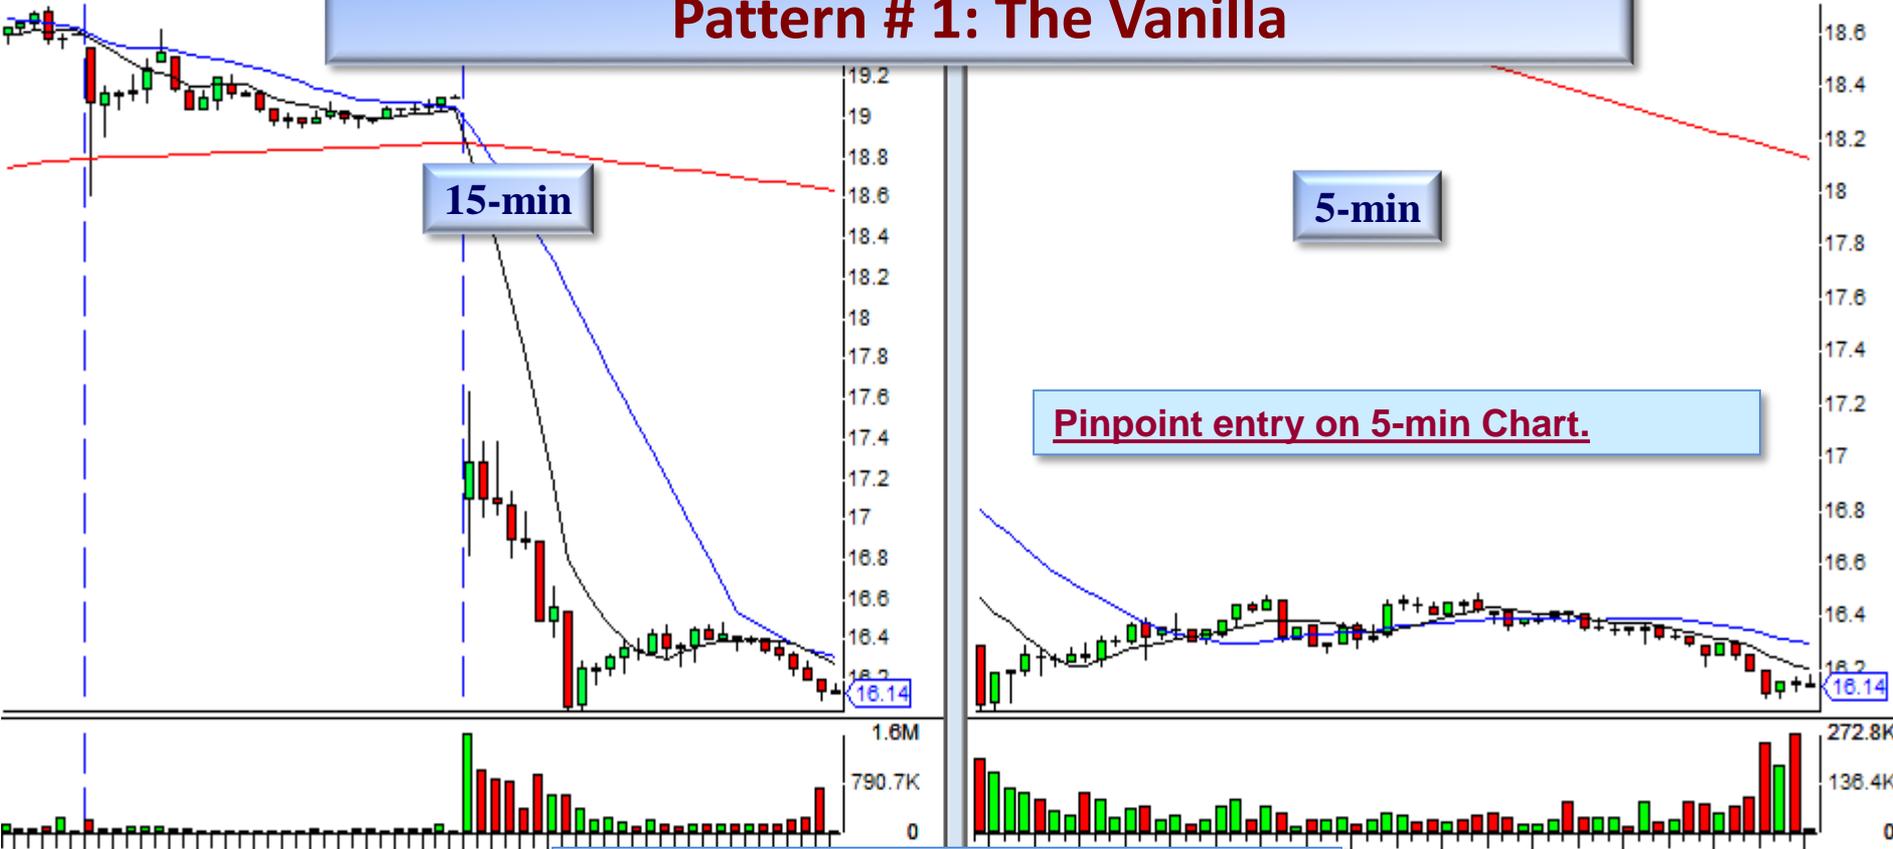

Pattern # 1: The Vanilla

A multi-bar pullback, inside of an igniting +WRB, to a smooth r20ma on 15-min and a smooth r40ma on 5-min. Note also the Breakdown with no follow through on the 5-min chart.

Variations on the 15-min Sell Setup (PSS)

Pattern # 1: The Vanilla

- PSS Action Steps**
1. Short below the prior bar's low
 2. Place stop above the prior bar's high or
 - 2a. Place stop above the current bar's high
 3. Set minimum target at the prior pivot low
 4. Manage in between the stop and target

Variations on the 15-min Sell Setup (PSS)

Pattern # 1: The Vanilla

15-min

2-min

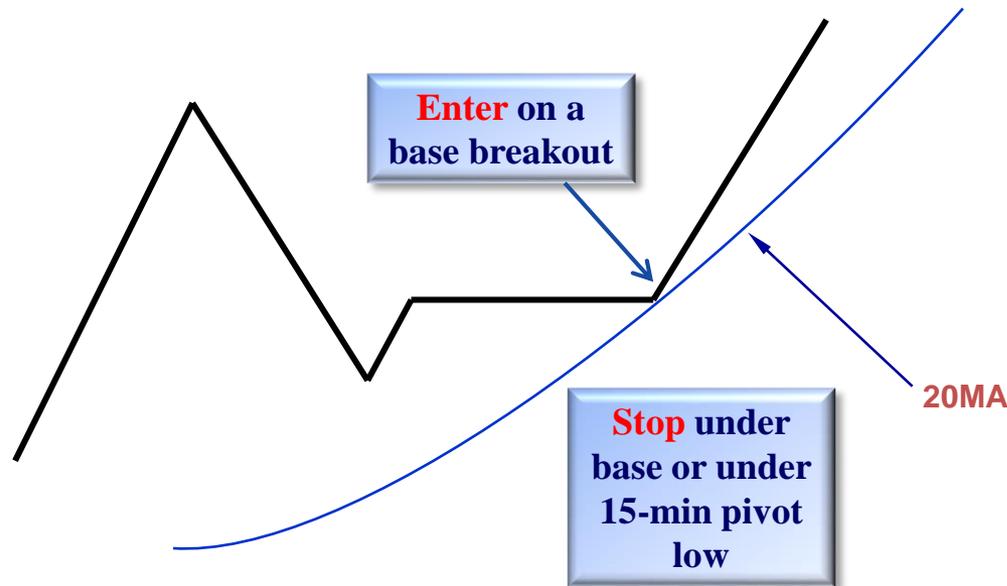

Pattern # 2: The Bleed My personal favorite

Pristine Tip:

Never take the 1st entry on a stock plagued by “trapped traders.” Let the stock prove that it has “healed”, either through time or price, before you enter.

Pattern description (The Bleed):

A 15-min that has “recovered” by going sideways after a rapid rally in the morning which resulted in a deep retracement. The “healing process” is complete and a Pristine Breakout (PBO) can be taken once the r20ma catches up with price. The entry combines a 2-min breakout/trend change inside of a 15-min Pristine Buy Setup (PBS).

Pattern # 2: The Bleed

A double bottom at the r20ma and at reversal time was not enough to compel this stock higher after putting in somewhat of a strong topping formation on the 15-min chart and a sloppy pullback. It took 3 hours of bullish consolidation and a major reversal time for the stock to get going. But once it did, the rest was history.

Pattern # 2: The Bleed

A strong counter-rally after rapid fall in the morning often needs time to heal and gather steam before it's ready to move lower again. The 15-min triggered a sell setup but the drop did not go anyway until the 20ma caught up with price. Enter short on a breakdown under the base, as price meets the d20ma.

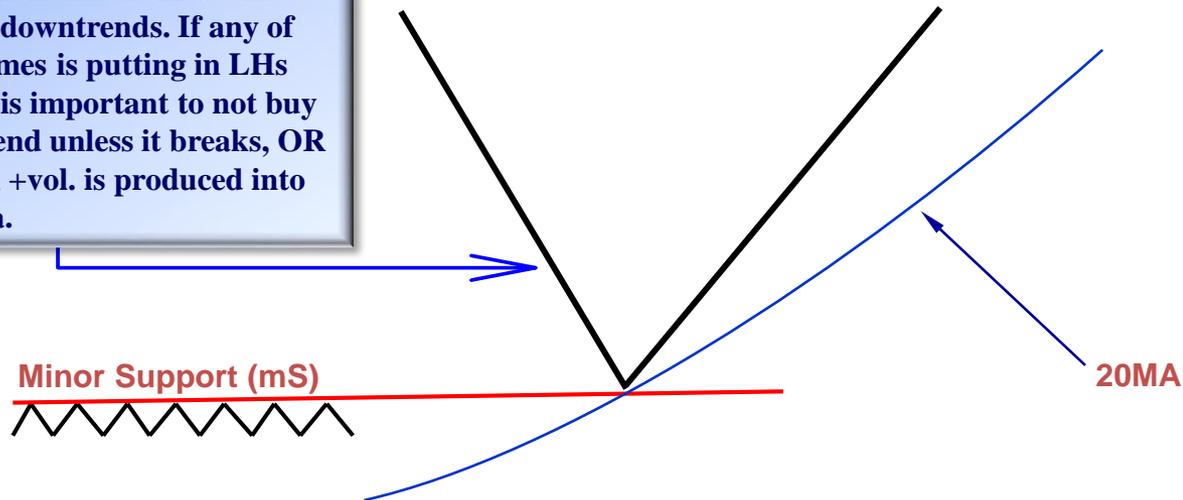

Pattern # 2: The Bleed

A strong rally into the gap fill (mR). The 15-min is played on base breakdown off the d20ma.

Pattern # 3: The Gap Fill

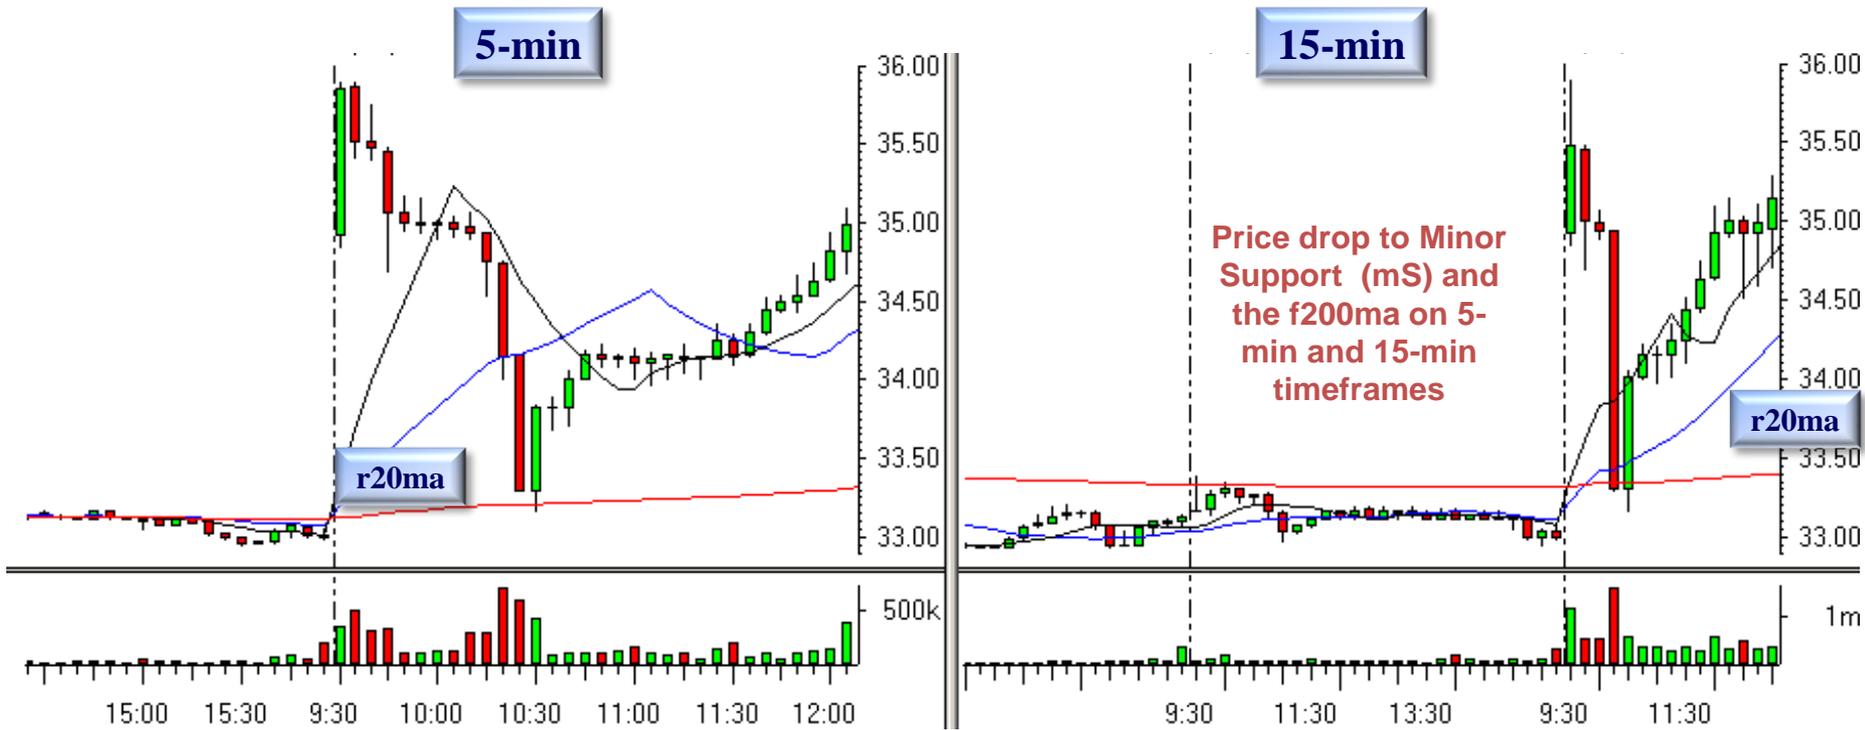

Note: While the stock is pulling back, the small timeframes will likely be in downtrends. If any of the timeframes is putting in LHs and LLs, it is important to not buy the downtrend unless it breaks, OR a -WRB on +vol. is produced into the mS area.

Pattern description (The Gap Fill):

A gap up in the stock and a rapid drop to the gap fill (could also be a flurry move down at the open). This drop to support is often solidified by a flat 200ma on the 15-min chart, or a rising 20ma on the 5-min or 15-min chart.

Pattern # 3: The Gap Fill

Variations on the 15-min Sell Setup (PSS)

Pattern # 3: The Gap Fill

Pattern # 3: The Gap Fill

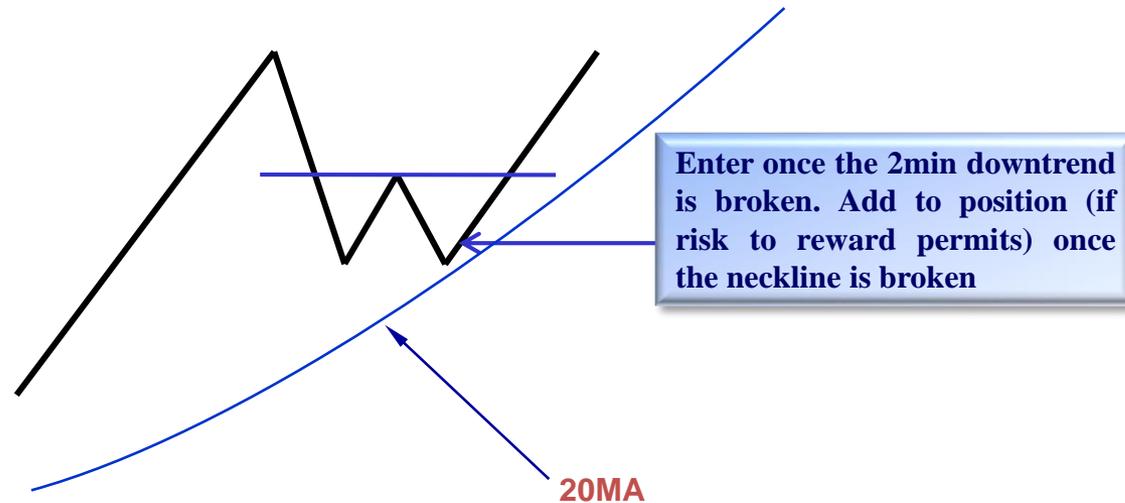

A strong stock with a Continuation Gap that has pulled back to gap fill (mS) and the r20ma on 15min chart.

Variations on the 15-min Sell Setup (PSS)

Pattern # 4: The W with a Double Bottom (DB)

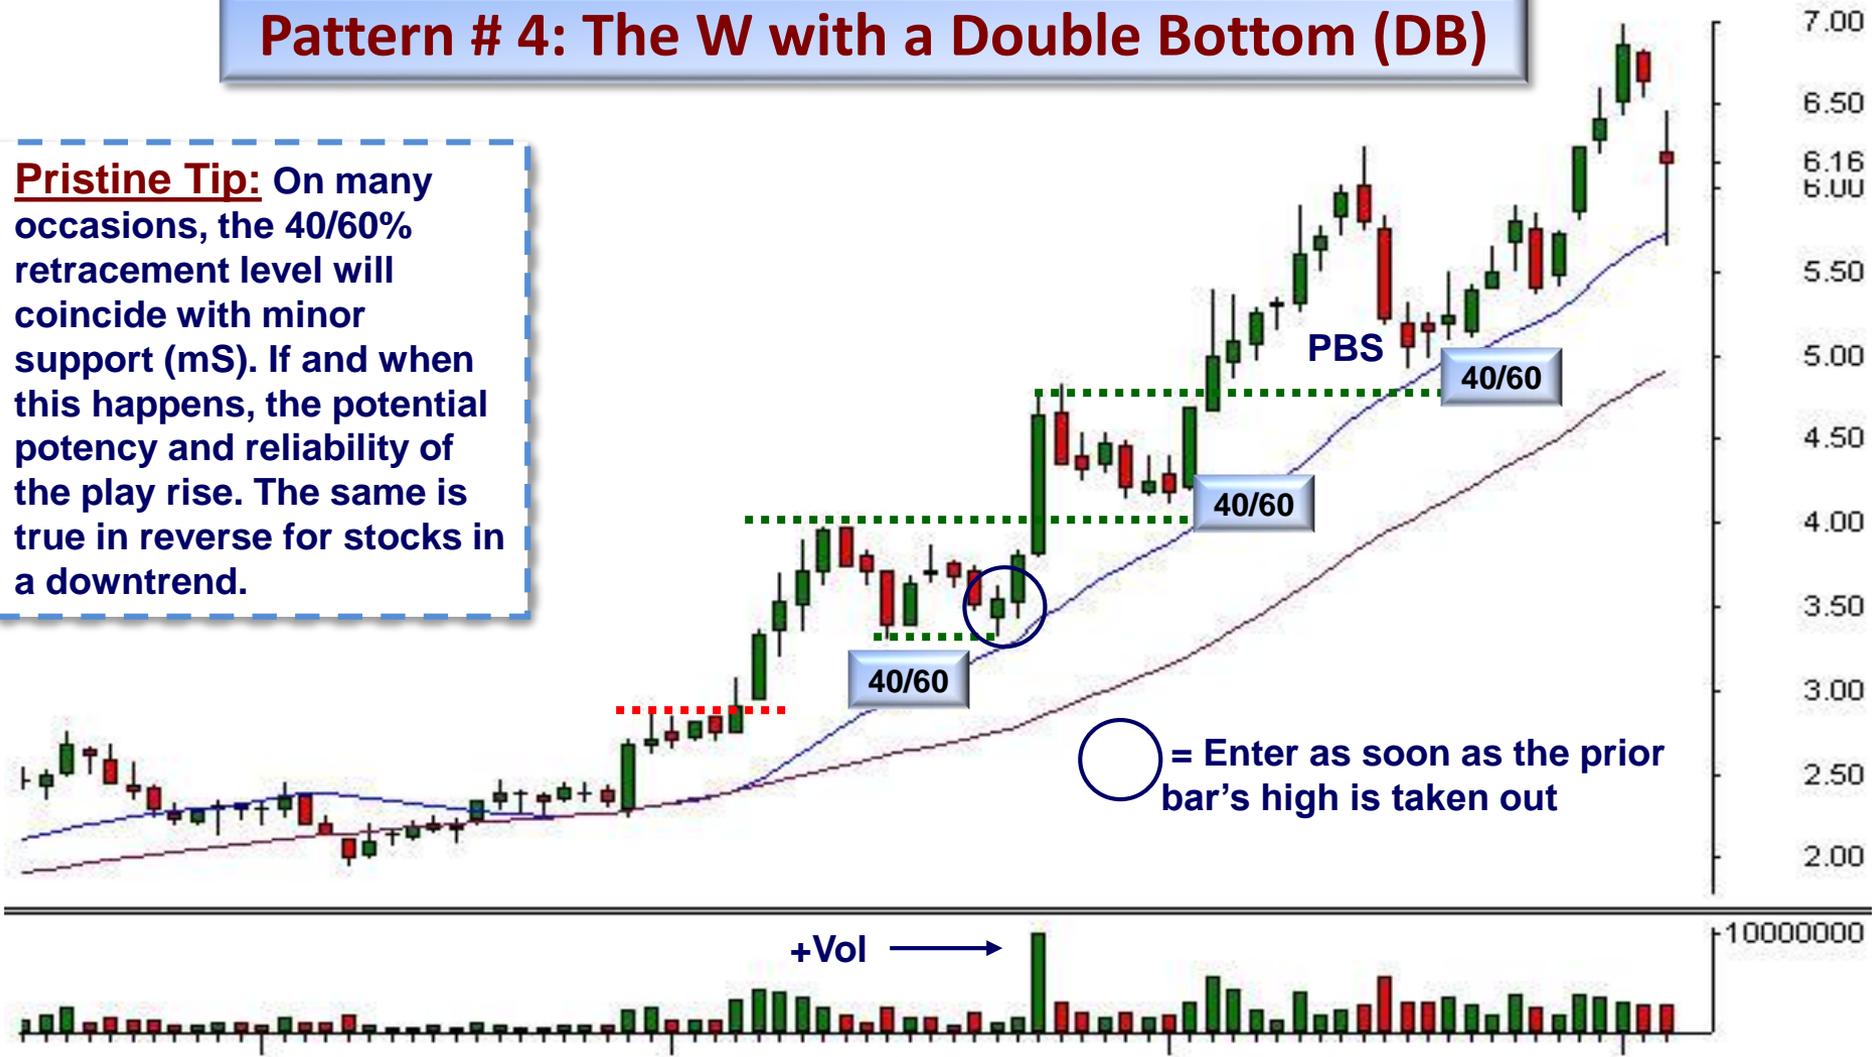

Pattern description (The W & DB):

A 15-min that has triggered a PBS but is not ready to go yet, either because the retracement is too deep, price is still extended from the 20ma, or the stock is waiting on the market. The healing process happens once the stock puts in a W pattern that sets up the unexpected. The downtrend on the 2-min chart suddenly ends and the double bottom suggests strength, which brings in additional traders that missed or passed on the initial PBS.

Variations on the 15-min Buy Setup (PBS)

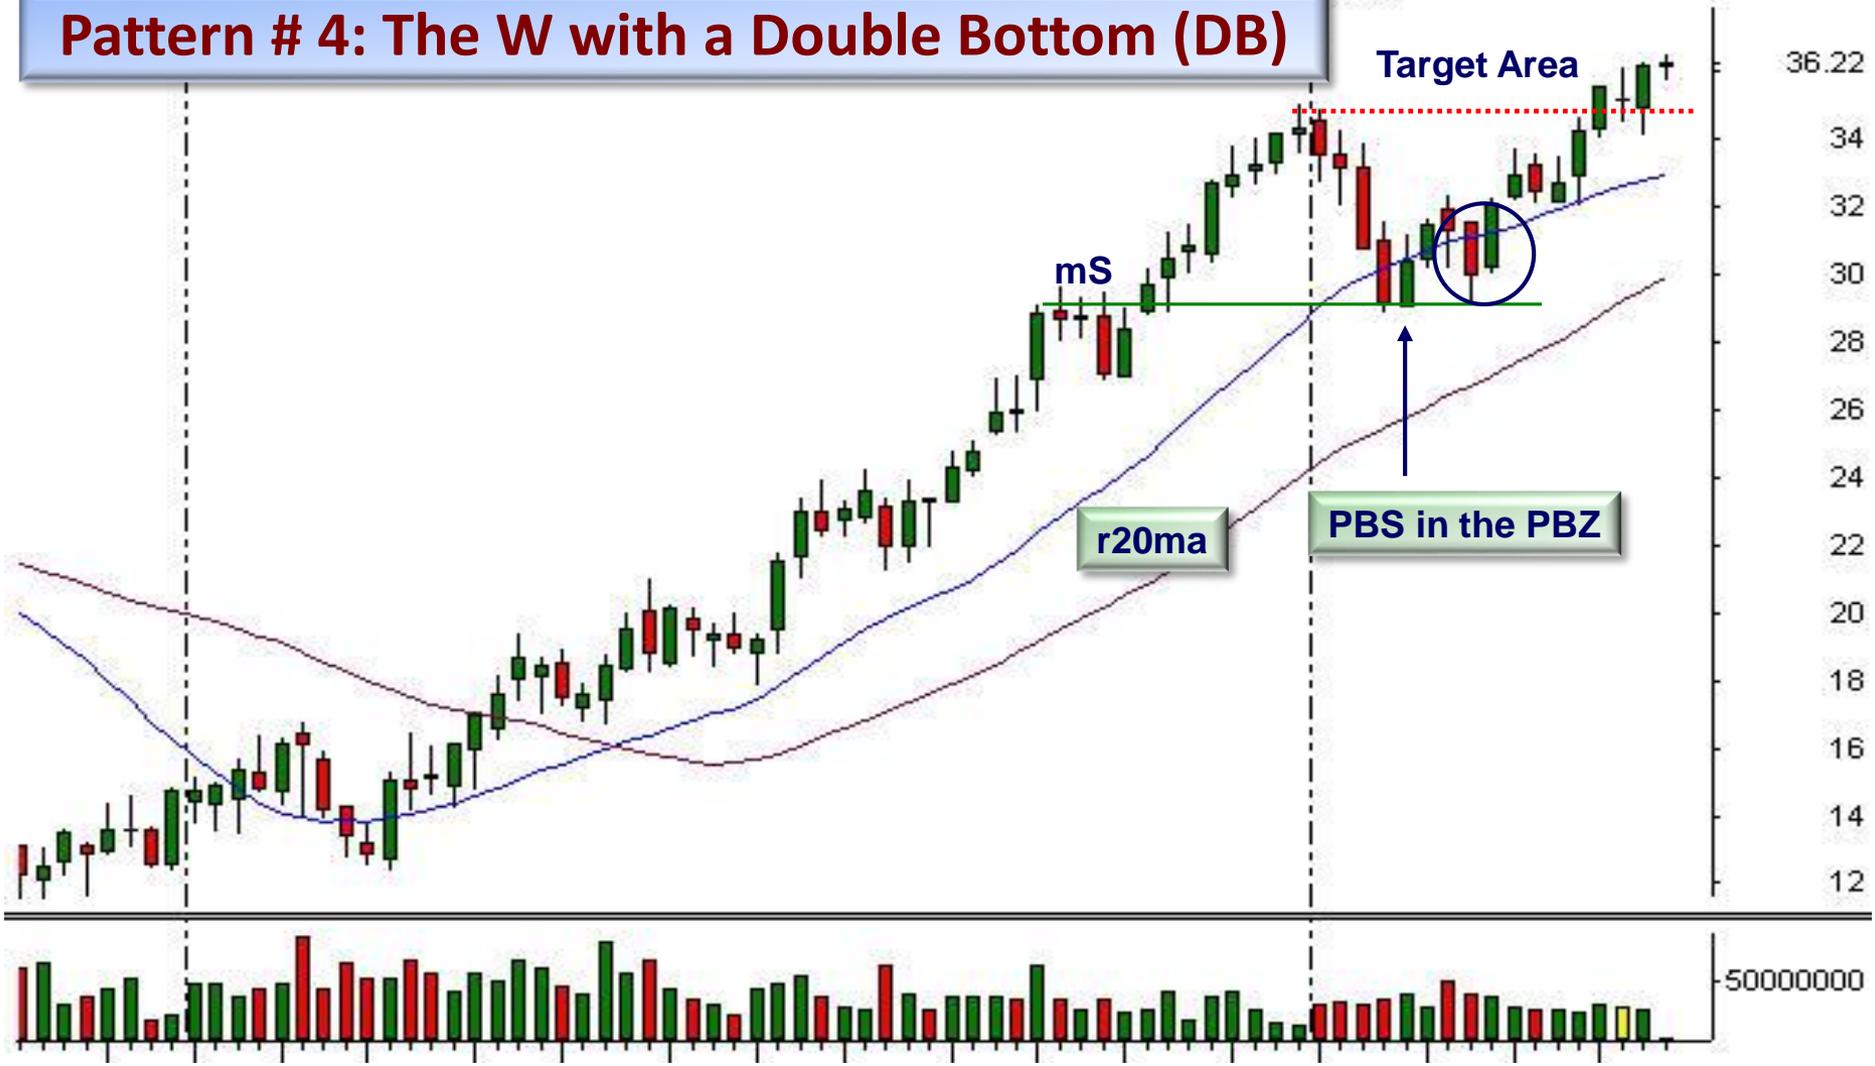

Pattern # 4: The W with a Double Bottom (DB)

Pristine Tip: On many occasions, the 40/60% retracement level will coincide with minor support (mS). If and when this happens, the potential potency and reliability of the play rise. The same is true in reverse for stocks in a downtrend.

Variations on the 15-min Buy Setup (PBS)

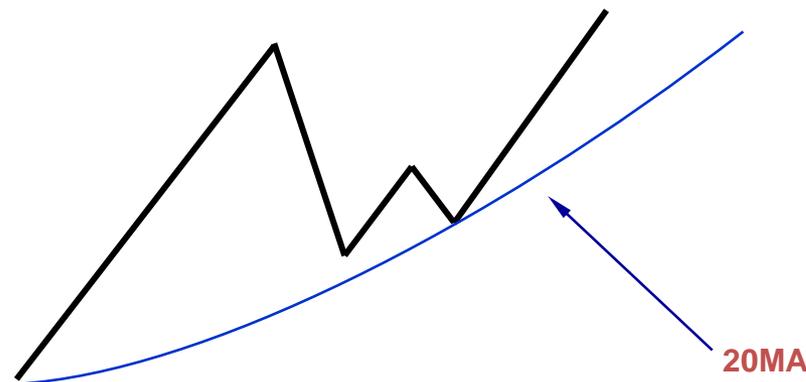

Pattern # 4: The W with a Double Bottom (DB)

Pattern # 4: The W with a Double Bottom (DB)

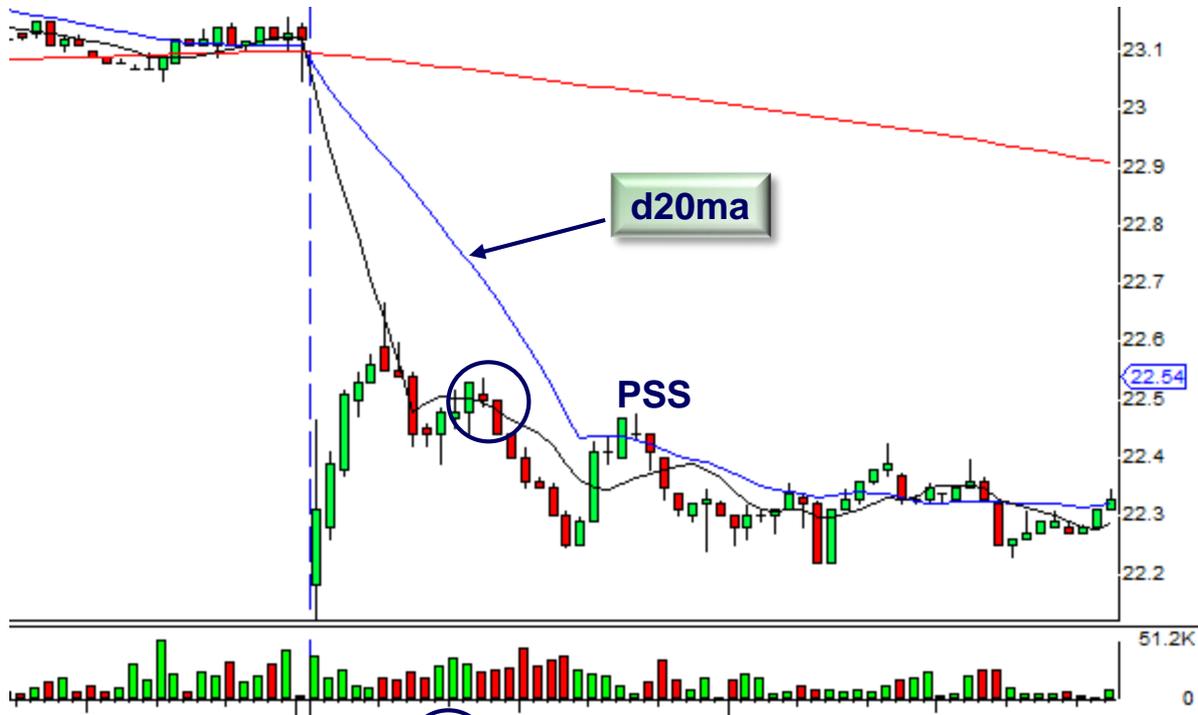

Pattern # 5: The W with a higher low (HL)

Pattern description (The W & HL):

A 15-min that has triggered a PBS but is not ready to go yet, either because the retracement is too deep, price is still extended from the 20ma, or the stock is waiting on the market. The healing process happens once the stock puts in a W pattern that setups up the unexpected. The downtrend on the 2-min chart suddenly ends and the higher low suggests strength, which brings in additional traders that missed or passed on the initial PBS.

Pattern # 5: The M with a lower high (LH)

○ = Enter as soon as the prior bar's low is taken out

Pattern # 5: The W with a higher low (HL)

○ = Enter as soon as the prior bar's high is taken out

Variations on the 15-min Buy Setup (PBS)

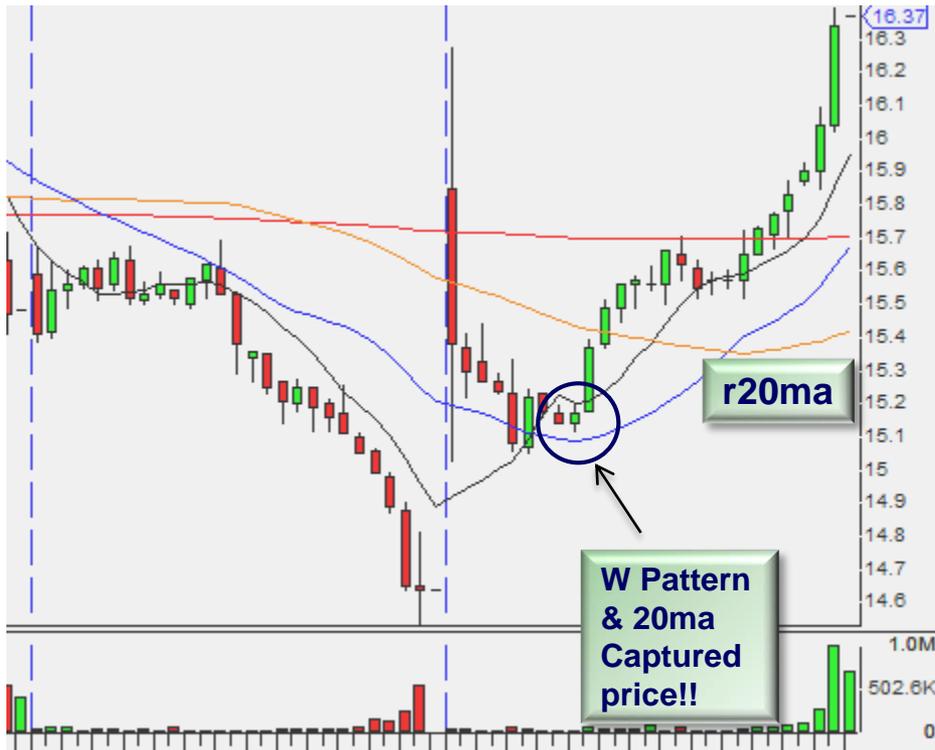

Pattern # 5: The W with a higher low (HL)

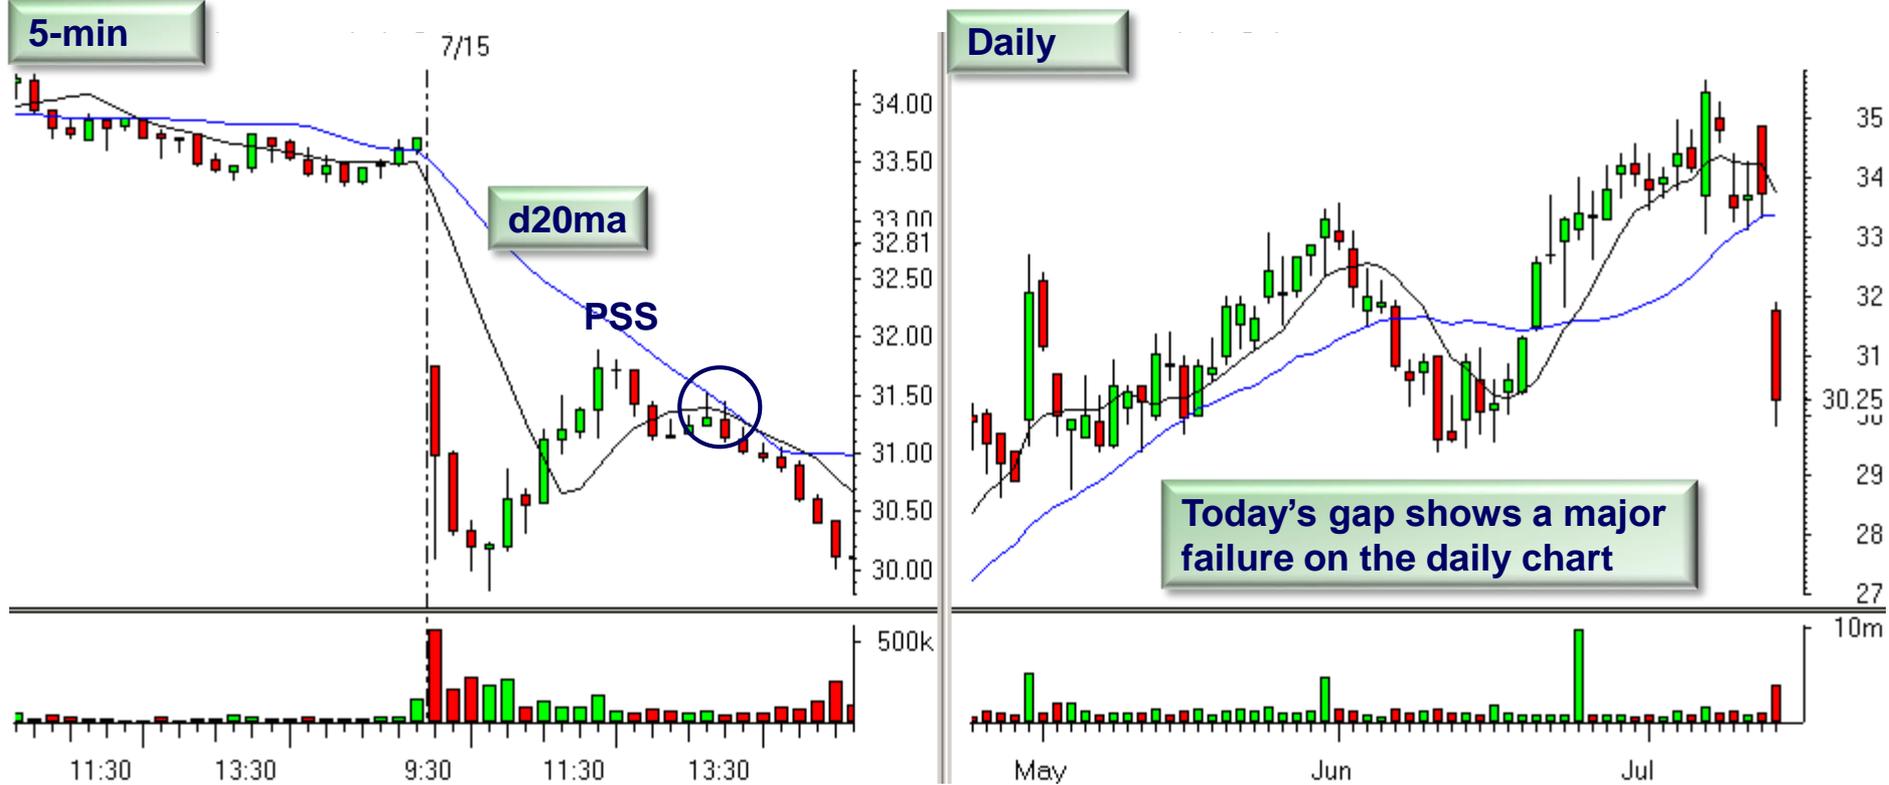

Question: Where is entry?

Variations on the 15-min Buy Setup (PBS)

Pattern # 5: The W with a higher low (HL)

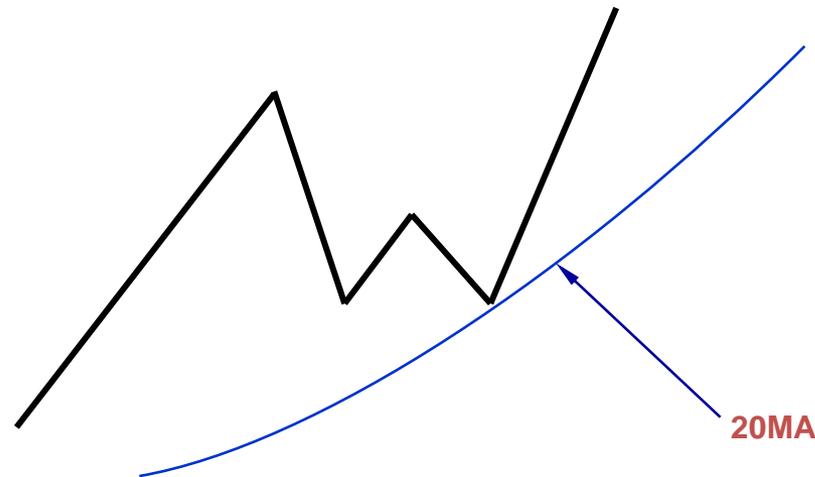

Pattern # 5: The M with a lower high (LH)

Shock Gaps and Failure Patterns set up the unexpected, thus trapping traders. This tends to cause major problems for most ordinary traders, but they can serve as major money making opportunities for us. In other words, we are always prepared to profit from the a stock's failed attempt to do something highly expected by the majority.

Pattern # 6: The W with a shakeout

Pattern description (The W & shake):

A 15-min that has triggered a PBS but is not ready to go yet, either because the retracement is too deep, price is still extended from the 20ma, or the stock is waiting on the market. After triggering a PBS, the stock appears to want to continue lower, and in fact, breaks under the prior pivot low on the 15-min chart, but only to get bought almost immediately. Weak hands are thus shaken out of the play and new shorts join in, expecting the 2-min downtrend to continue. This helps to fuel the rally and complete a W pattern on the 15-min chart.

Variations on the 15-min Sell Setup (PSS)

Pattern # 6: The M with a shakeout

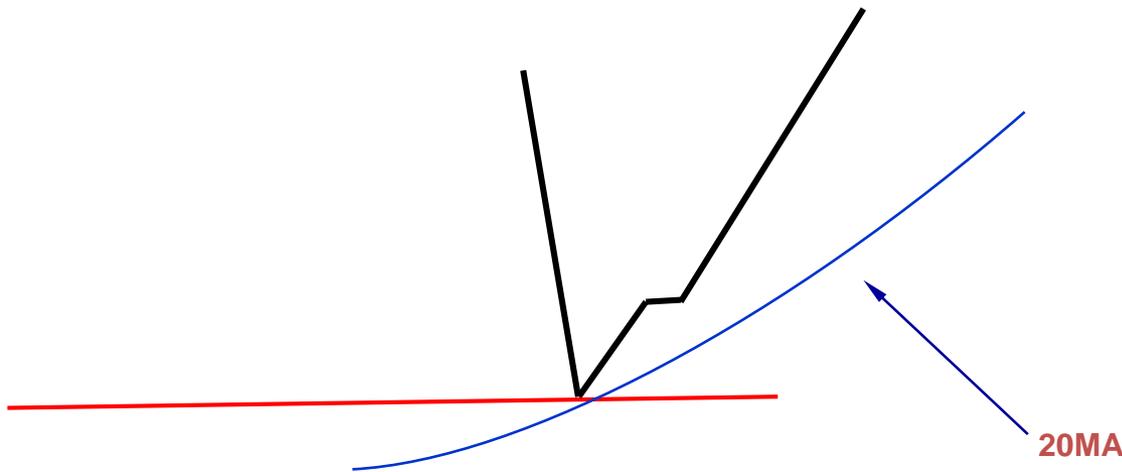

Pattern # 6: The W with a shakeout

————— = possible “add” location

Pattern # 7: The Mini into a Flat 200ma

Pattern description (Mini into 200ma):

A multi bar drop into a 200ma on the 15-min chart often stops the stock dead in its tracks. While the 20ma is most powerful when it's trending, the 200ma is most powerful when it's flat. Combine that with a mini climactic drop with volume surge at the end, and you get a strategy that can be traded almost independently of anything else.

Pattern # 7: The Mini into a Flat 200ma

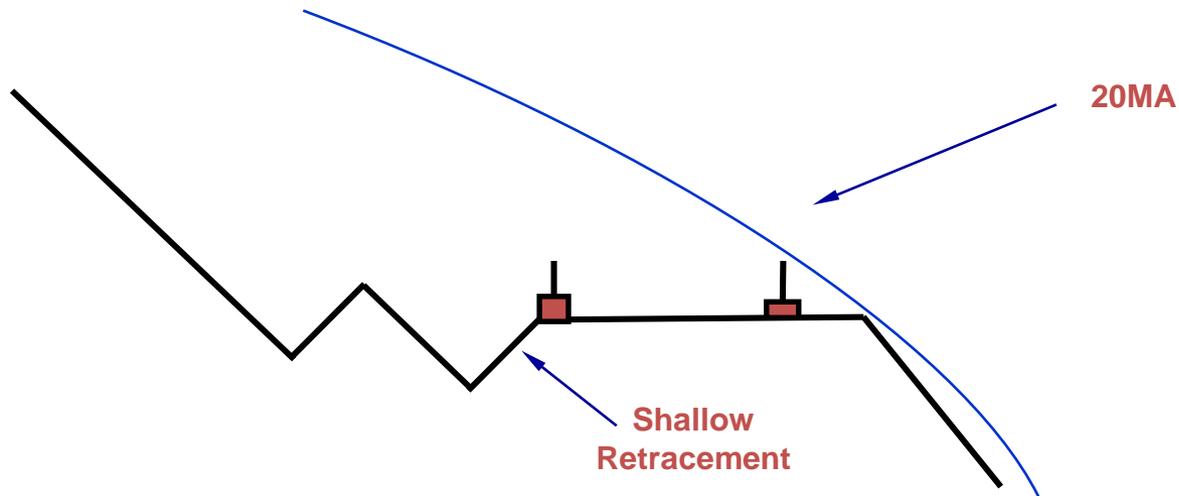

A multi-bar rally into the flat 200ma and d20ma on 15-min chart. Note also the flat 200ma on the 5-min chart and the prior high/minor Topping Tail from the open.

Pattern # 7: The Mini into a Flat 200ma

A two day drop into the flat 200ma and a narrow range, changing of the guard bar. Note also the WRB, surge in volume, at 11:15 RT.

Pattern # 8: Twin Peaks

Pattern description (Twin Peaks):

A bearish stock that puts in a shallow retracement (counter rally) and goes sideways. Instead of breaking down, the stock retests the prior pivot high, which is typically a topping tail. The green (retest) bar is immediately sold and turns into a TT bar. The stock then breaks down under the base. This R&F makes the shallow retracement playable, when it would not have been otherwise.
